

INTEGRATED OILFIELD SERVICES – OPERATION FLOW

- Drilling services
- Well services
- Marine support and transportation services
- Geophysical services

Oilfield services work around each phase of the exploration, development and production of offshore oil and natural gas.

The first stage, exploration, is a vital part of the of Exploration and Production (E&P) cycle, as it includes the seismic data collection, exploration well drilling, appraisal activities and testing of potential oilfields to ensure commercial viability.

Development, the second stage of the cycle, puts the results of the exploration stage into practice. Heavy drilling activities are involved at this stage.

The final stage, production, involves transporting the crude oil, reservoir management, workovers for production wells, adjustments and injection of well drilling, among other tasks.

As an integrated oilfield services provider, COSL offers comprehensive services that cater to the needs of E&P companies at each phase of the cycle, from drilling services, of well services, marine support and transportation to geophysical services.
